

# Leet Cyber Security

Website <http://www.leetcybersecurity.com>

Leet Cyber Security was founded in 2010 after seeing many organizations struggle with the same basic security issues regarding cyber threats, vulnerability identification and vulnerability management. Many organizations implement modern security controls, harden systems and educate users. However, those same organizations fail to identify a critical element; what a real-world attacker “ seeking to gain access to critical assets ” would attempt and how they might bypass even the most up-to-date security controls.

Nonprofit Description Leet Cyber Security is solely focused on providing actionable threat-centric guidance based on pragmatic threat tactics rather than simply parroting academic best practices. Using the Leet methodology, our clients are provided with the knowledge & guidance to significantly lower organizationally wide cyber risk.

Non-profit organizations find value in Leet's expertise by identifying security vulnerabilities which criminals, hackers or terrorists would aim to exploit, so that non-profit organizations can become more confidently secure with their cyber landscape and keep all digital assets protected. The output from our engagements becomes the input for proper ranking and prioritization of security issues, providing proper risk management for our clients.
